ABSTRACT

The World Health Organization (WHO) announced a pandemic on March 11, 2020. The COVID-19 pandemic has spread rapidly to more than 17,660,523 cases with 680,894 deaths affecting 260 countries as of August 2020. The COVID-19 situation in Indonesia is approximately 130,718 positive cases, with 85,798 recovered cases and 5,903 deaths as of August 2020 which has spread to 34 provinces in Indonesia. The most COVID-19 sufferers are in DKI Jakarta (26,642 cases), East Java (25,917 cases), Central Java (10,765 cases). The aim of the researchers was to find out the description of PT, INR and APTT in patients with Covid-19 at a North Jakarta private hospital. The type of research that will be used is descriptive research with a cross-sectional approach. Secondary data collection was carried out from March 2020 to May 2021 at the North Jakarta Private Hospital. The number of respondents with Covid-19 was 150 respondents. The results showed that male respondents were 63.3% and women were 36.7%. The percentage of normal PT APTT results data at the age of 5 people (33.3%), adults 47 people (31.3%), and 43 people (28.6%) in the elderly and 5 people (33.3%), adults 29 people (19.3%), and 21 elderly people (14%).
